

SECURITY TESTING SERVICES

Performance Testing:

Application vulnerabilities leave your system open to attacks, Downtime, Data theft, Data corruption and application Defacement. Security within an application or web service is crucial to avoid such vulnerabilities and new threats.

We provide complete security testing service to support all the software testing needs of an organization or business unit. To determine how well the application stands up to a concentrated attack, we offer Penetration Testing, Network Access Controls and Firewalls service.

InfoSage Systems vulnerability testing service extensively tests your application for possible security loopholes to ensure your application or system is secured against the security threats.

While automated tools can help to eliminate many generic security issues, the detection of application vulnerabilities requires independent evaluation of your specific application's features and functions by experts. An external security vulnerability review by InfoSage System's Testing will give you the best possible confidence that your application is as secure as possible.

Information Security:

Ensuring that the system preserves the confidentiality, integrity and availability of information

Confidentiality:

Ensuring that information is accessible only to those authorized to have access.

Integrity:

Ensuring the accuracy and completeness of information and processing methods.

Availability:

Ensuring that authorized users have access to information and associated assets when required

Our security testing services ensure:

- Applications are secure against known and unknown vulnerabilities
- Application data is secure and hack proof
- Applications are compliant with all security regulations
